## [If adopted, this would be a new regulation] [Changes to Draft #1 are redlined and double underlined]

- REGULATION 5.22 Procedures for Determining the Maximum Ambient Concentration of a Toxic Air Contaminant
- 3 Air Pollution Control District of Jefferson County
- 4 Jefferson County, Kentucky

- **Relates To:** KRS Chapter 77 Air Pollution Control
- **Pursuant To:** KRS Chapter 77 Air Pollution Control
- **Necessity and Function:** KRS 77.180 authorizes the Air Pollution Control Board to adopt and
- 8 enforce all orders, rules, and regulations necessary or proper to accomplish the purposes of KRS
- 9 Chapter 77. This regulation establishes the procedures for determining the maximum concentration
- of a toxic air contaminant in the ambient air.

#### 11 SECTION 1 Determining the Maximum Ambient Concentration of a Toxic Air Contaminant

- 1.1 The maximum ambient concentration of a toxic air contaminant determined <u>by using</u> one of the procedures in Sections 2 to 5 shall be used to determine compliance with the ambient levels for environmental acceptability (EA levels) established in Regulation 5.21 *Environmental Acceptability for Toxic Air Contaminants*.
- 1.2 For intermittent emissions, the average emission rate may be used to determine the maximum ambient concentration if the average rate is not less than 10% of the maximum hourly rate. Intermittent emissions are emissions that are not allowed to be emitted continuously for the entire length of the time specified in Regulation 5.20 *Methodology for Determining Benchmark Ambient Concentration of a Toxic Air Contaminant* as the applicable averaging time for a benchmark ambient concentration.
- 1.3 Each procedure in Sections 2 to 5 represents an acceptable method for determining the maximum ambient concentration of a toxic air contaminant, although there are stated limitations for the use of the Tier 2 procedure. In general, the intent is that the Tier 1 procedure is the most simple to use, requires the least amount of process- and process equipment-specific information, and provides the most conservative maximum ambient concentration; proceeding on a continuum, the Tier 4 procedure is the most complex to use, requires the greatest amount of process- and process equipment-specific information, and provides the least conservative maximum ambient concentration. The following is a brief description of the four procedures:
- 1.3.1 Tier 1 Table 1: Simple Factor for Determining Maximum Ambient Concentration: The allowed emission rate for the appropriate averaging time for the specific toxic air contaminant is divided by a factor from the table to give the maximum ambient concentration.
- 1.3.2 Tier 2 Table 2: Annual Factor: The allowed hourly emission rate is divided by the appropriate annual factor from the table to give the maximum ambient concentration. The annual factor from the table depends on the building height, stack height-to-building height ratio, and the distance to the closest secured property line, and the annual factor from the table may be adjusted depending on the averaging time of the benchmark ambient concentration for the specific toxic air contaminant.
- 1.3.3 Tier 3 SCREEN3 and TSCREEN Models: The output of these screening models is the maximum hourly ambient concentration. The maximum hourly ambient concentration

## [If adopted, this would be a new regulation] [Changes to Draft #1 are redlined and double underlined]

may be multiplied by an adjustment factor depending on the averaging time of the benchmark ambient concentration for the specific toxic air contaminant. The models contain different algorithms based upon the type of release, for example, stack or fugitive. Basic dispersion modeling parameters are required, such as building height and dimensions, stack height, stack diameter, exhaust gas flow rate, exhaust gas temperature, and emission rate for a stack emission.

- 1.3.4 Tier 4 EPA-Approved Dispersion Model: The output of these highly complex models is the maximum ambient concentration for the identified averaging time, which is set within the model depending on the averaging time of the benchmark ambient concentration for the specific toxic air contaminant. The models contain different algorithms based upon the type of release, for example, stack or fugitive. Detailed dispersion modeling parameters are required.
- 1.4 If there is not an established applicable emission limit for a toxic air contaminant (TAC), then the potential to emit for that TAC shall be used. However, pursuant to Regulation 5.21 Section 4.3, the owner or operator of the stationary source may request a new emission limit for that TAC that, upon receipt by the District, may be used to determine the maximum ambient concentration pursuant to Regulation 5.22.
- 1.5 If the District determines that the model chosen, model options, or model inputs are not appropriate to model the emissions from a process or process equipment, then the District may disapprove the results of the modeling demonstration.

## SECTION 2 Tier 1 - Table 1: Simple Factor for Determining Maximum Ambient Concentration

- 2.1 The maximum concentration of a toxic air contaminant from a process or process equipment in the ambient air may be determined by using the appropriate factor from Table 1 and the applicable Equation 1 to 4. The appropriate factor is determined by the averaging time for a specific toxic air contaminant, which is established in Regulation 5.20. The calculated maximum concentration is then used in determining compliance with the EA levels in Regulation 5.21 by using the applicable equation in Regulation 5.21 section 2.2, 2.5, or 2.8. If Table 1 contains two factors for a benchmark ambient concentration averaging time, then the factor that results in the greater maximum concentration shall be used.
- 2.2 Table 1 Simple Factor for Determining Maximum Concentration reads as follows:

Table 1
Simple Factor for Determining Maximum Ambient Concentration

BAC¹ Averaging Time	Annual Factor (F <sub>A</sub> ) <sup>2</sup>	24-Hour Factor (F <sub>24</sub> ) <sup>3</sup>	8-Hour Factor (F <sub>8</sub> ) <sup>4</sup>	1-Hour Factor (F <sub>1</sub> ) <sup>5</sup>
Annual	480			0.54
24 hours		0.12		0.05
8 hours			0.02	0.02
1 hour				0.001

## [If adopted, this would be a new regulation] [Changes to Draft #1 are redlined and double underlined]

83		Notes for Table 1:
84		<sup>1</sup> BAC is the benchmark ambient concentration of a toxic air contaminant as
85		determined pursuant to Regulation 5.20.
86		The Annual Factor $F_A$ is in units of (lb/year)/( $\mu$ g/m <sup>3</sup> ). Use Equation 1.
87		The 24-Hour Factor $F_{24}$ is in units of (lb/24 hours)/( $\mu$ g/m <sup>3</sup> ). Use Equation 2.
88		The 8-Hour Factor $F_8$ is in units of (lb/8 hours)/( $\mu$ g/m <sup>3</sup> ). Use Equation 3.
89		The 1-Hour Factor $F_1$ is in units of (lb/1 hour)/( $\mu$ g/m <sup>3</sup> ). Use Equation 4.
90		Maximum Concentration <sub>ij</sub> = $\frac{Allowed \ annual \ emission_{ij}}{F_A}$ Equation 1
91		Maximum Concentration <sub>ij</sub> = $\frac{Allowed 24-hour \ emission_{ij}}{F_{24}}$ Equation 2
92		Maximum Concentration <sub>ij</sub> = $\frac{Allowed \ 8-hour \ emission_{ij}}{F_8}$ Equation 3
93		Maximum Concentration <sub>ij</sub> = $\frac{Allowed \ 1-hour \ emission_{ij}}{F_1}$ Equation 4
94		Where: i = an individual toxic air contaminant, from
95		j = an individual process or process equipment,
96		Allowed emission is in units of pounds per the applicable time period,
97		and
98		Maximum Concentration is in units of $\mu g/m^3$ .
99	SECT	8
100	2 1	Concentration
101	3.1	The maximum concentration of a toxic air contaminant from a process or process equipment in the ambient air may be determined by using the appropriate approal factor from Table 2.
102 103		in the ambient air may be determined by using the appropriate annual factor from Table 2 (adjusted if appropriate) and Equation 5. The calculated maximum concentration is then
103		used in determining compliance with the EA levels in Regulation 5.21 by using the
104		applicable equation in Regulation 5.21 section 2.2, 2.5, or 2.8.
105	3.2	The use of Table 2 requires information about the dispersion characteristics of the source of
107	3.2	emissions, namely, the distance to the nearest secured property line, the height of the stack,
108		and, as described in section 3.7.2, the height of the influential building.
109	3.3	Table 2 shall not be used if any of the following provisions applies:
110	3.3.1	The stack height is less than 10 feet or the emission is a fugitive emission,
111	3.3.2	The influential building height is more than 100 feet,
112	3.3.3	There are terrain elevations that are more than 25% of the discharging stack height within
113		a distance of 500 feet from the stack, or
114	3.3.4	The analysis is for an elevated receptor, for example, a hospital air intake.
115	3.4	The annual factor value derived from Table 2 is the ratio of the annual averaged hourly

# [If adopted, this would be a new regulation] [Changes to Draft #1 are redlined and double underlined]

Maximum Concentration,   = Allowed 1-hour emission,     Equation 5  Where:   i = an individual toxic air contaminant, from   j = an individual process or process equipment, and   annual (adjusted) factor is the annual factor derived from Table 2, including any adjustment required by section 3.5.  Instructions for deriving the annual factor from Table 2 are as follows:  Determine the height of the discharging stack from ground level in feet (H <sub>b</sub> ). Determine the height of the influential building in feet (H <sub>b</sub> ). This is done by first identifying all buildings, including buildings on-site and off-site, located within a distance of 5 times their height from the discharging stack. Then, determine which building is the highest. This is the influential building, with height (H <sub>b</sub> ) in feet. If the stack is not attached to a building, then a building height of 40% of the stack height shall be assumed.  Determine the ratio of the stack height to the influential building height by dividing the stack height, in feet, by the influential building height, in feet, H <sub>s</sub> /H <sub>b</sub> .  Determine the minimum distance, in feet, from the discharging stack to the secured property line. If there is no secured property line, then a distance of 25 feet shall be used.  Determine the appropriate annual factor from Table 2. This is done by selecting the row with the appropriate minimum distance to the secured property line.  If the influential building height and H <sub>s</sub> /H <sub>b</sub> ratio, and selecting the row with the appropriate minimum distance to the secured property line.  If the influential building height is between values in the column headings, then use the lower value or interpolate between values in the column headings, then use the lower value or interpolate between values in the column headings.  If H <sub>s</sub> /H <sub>b</sub> is between 1.25 and 1.75, then use the 1.25 column.  If H <sub>s</sub> /H <sub>b</sub> is between 1.25 and 1.75, then use the 1.25 column or interpolate between the 1.25 and 1.75 columns.  If H <sub>s</sub> /H <sub>b</sub> is greater than or equal to 2.5, then use the 2.5 colu	116 117 118 119 120 121 122 123 124 125 126 127	3.5.1 3.5.2 3.5.3 3.6	emission rate divided by the maximum annual ambient impact, in units of (lbs/hr)/( $\mu$ g/m³). The annual factor shall be adjusted if the averaging time of the benchmark ambient concentration (BAC) for the specific toxic air contaminant as determined pursuant to Regulation 5.20 is different than annual. This adjustment is done as follows: 24-hr factor (lbs/hr)/( $\mu$ g/m³) = annual factor $\otimes$ 0.091. 8-hr factor (lbs/hr)/( $\mu$ g/m³) = annual factor $\otimes$ 0.046. 1-hr factor (lbs/hr)/( $\mu$ g/m³) = annual factor $\otimes$ 0.02. Determine the maximum concentration. This is done by using the allowed hourly emission limit (lb/hr), taking into account the intermittent emission provision of section 1.23, for a toxic air contaminant from a process or process equipment; the annual factor as derived from Table 2 and, if appropriate, making the adjustment pursuant to section 3.5; and performing the calculation in Equation 5. The resulting maximum concentration is in units of $\mu$ g/m³:						
Where: i = an individual toxic air contaminant, from j = an individual process or process equipment, and annual (adjusted) factor is the annual factor derived from Table 2, including any adjustment required by section 3.5.  Instructions for deriving the annual factor from Table 2 are as follows:  Determine the height of the discharging stack from ground level in feet (H <sub>a</sub> ).  Determine the height of the influential building in feet (H <sub>b</sub> ). This is done by first identifying all buildings, including buildings on-site and off-site, located within a distance of 5 times their height from the discharging stack. Then, determine which building is the highest. This is the influential building, with height (H <sub>b</sub> ) in feet. If the stack is not attached to a building, then a building height of 40% of the stack height shall be assumed.  3.7.3 Determine the ratio of the stack height to the influential building height by dividing the stack height, in feet, by the influential building height, in feet, H <sub>s</sub> /H <sub>b</sub> .  Determine the minimum distance, in feet, from the discharging stack to the secured property line. If there is no secured property line, then a distance of 25 feet shall be used.  Determine the appropriate annual factor from Table 2. This is done by selecting the column with the appropriate influential building height and H <sub>s</sub> /H <sub>b</sub> ratio, and selecting the row with the appropriate influential building height and H <sub>s</sub> /H <sub>b</sub> ratio, and selecting the row with the appropriate influential building height and H <sub>s</sub> /H <sub>b</sub> ratio, and selecting the row with the appropriate influential building height and H <sub>s</sub> /H <sub>b</sub> ratio, and selecting the row with the appropriate influential building height and H <sub>s</sub> /H <sub>b</sub> ratio, and selecting the row with the appropriate influential building height and H <sub>s</sub> /H <sub>b</sub> is between 1.25 and 1.75, then use the 1.25 column or interpolate between the 1.25 and 1.75 columns.  If H <sub>s</sub> /H <sub>b</sub> is between 1.25 and 1.75, then use the 1.25 column or interpolate between the 1.75 and 2.5 columns.	128		Allowed 1-hour emission,						
j = an individual process or process equipment, and annual (adjusted) factor is the annual factor derived from Table 2, including any adjustment required by section 3.5.  Instructions for deriving the annual factor from Table 2 are as follows:  3.7.1 Determine the height of the discharging stack from ground level in feet (H <sub>a</sub> ).  Determine the height of the influential building in feet (H <sub>b</sub> ). This is done by first identifying all buildings, including buildings on-site and off-site, located within a distance of 5 times their height from the discharging stack. Then, determine which building is the highest. This is the influential building, with height (H <sub>b</sub> ) in feet. If the stack is not attached to a building, then a building height of 40% of the stack height shall be assumed.  Determine the ratio of the stack height to the influential building height by dividing the stack height, in feet, by the influential building height, in feet, H <sub>s</sub> /H <sub>b</sub> .  Determine the minimum distance, in feet, from the discharging stack to the secured property line. If there is no secured property line, then a distance of 25 feet shall be used.  Determine the appropriate annual factor from Table 2. This is done by selecting the column with the appropriate influential building height and H <sub>s</sub> /H <sub>b</sub> ratio, and selecting the row with the appropriate influential building height and H <sub>s</sub> /H <sub>b</sub> ratio, and selecting the row with the appropriate influential building height and H <sub>s</sub> /H <sub>b</sub> ratio, and selecting the and use the 1.25 H <sub>s</sub> /H <sub>b</sub> column.  If H <sub>s</sub> is less than H <sub>b</sub> , then set the influential building height equal to the stack height and use the 1.25 H <sub>s</sub> /H <sub>b</sub> column.  If H <sub>s</sub> /H <sub>b</sub> is between 1 and 1.25, then select the 1.25 column or interpolate between the 1.25 and 1.75 columns.  If H <sub>s</sub> /H <sub>b</sub> is between 1.75 and 2.5, then use the 1.75 column or interpolate between the 1.75 and 2.5 columns.			Maximum Concentration <sub>ij</sub> = $\frac{1}{\text{annual (adjusted) factor}}$ Equation 5						
annual (adjusted) factor is the annual factor derived from Table 2, including any adjustment required by section 3.5. building is the highest. This is the influential building, with height (H <sub>b</sub> ) in feet. If the stack is not attached to a building, then a building height of 40% of the stack height shall be assumed.  3.7.3 Determine the ratio of the stack height to the influential building height by dividing the stack height, in feet, by the influential building height, in feet, H <sub>s</sub> /H <sub>b</sub> .  3.7.4 Determine the minimum distance, in feet, from the discharging stack to the secured property line. If there is no secured property line, then a distance of 25 feet shall be used.  3.7.5 Determine the appropriate annual factor from Table 2. This is done by selecting the column with the appropriate influential building height and H <sub>s</sub> /H <sub>b</sub> ratio, and selecting the row with the appropriate minimum distance to the secured property line.  If the influential building height is between values in the column headings, then use the lower value or interpolate between values in the column headings.  If H <sub>s</sub> is less than H <sub>b</sub> , then set the influential building height equal to the stack height and use the 1.25 H <sub>s</sub> /H <sub>b</sub> column.  If H <sub>s</sub> /H <sub>b</sub> is between 1 and 1.25, then select the 1.25 column.  If H <sub>s</sub> /H <sub>b</sub> is between 1.25 and 1.75, then use the 1.25 column or interpolate between the 1.25 and 1.75 columns.  If H <sub>s</sub> /H <sub>b</sub> is between 1.75 and 2.5, then use the 1.75 column or interpolate between the 1.75 and 2.5 columns.	136		identifying all buildings, including buildings on-site and off-site, located within a						
stack is not attached to a building, then a building height of 40% of the stack height shall be assumed.  3.7.3 Determine the ratio of the stack height to the influential building height by dividing the stack height, in feet, by the influential building height, in feet, H <sub>s</sub> /H <sub>b</sub> .  3.7.4 Determine the minimum distance, in feet, from the discharging stack to the secured property line. If there is no secured property line, then a distance of 25 feet shall be used.  Determine the appropriate annual factor from Table 2. This is done by selecting the column with the appropriate influential building height and H <sub>s</sub> /H <sub>b</sub> ratio, and selecting the row with the appropriate minimum distance to the secured property line.  If the influential building height is between values in the column headings, then use the lower value or interpolate between values in the column headings.  If H <sub>s</sub> is less than H <sub>b</sub> , then set the influential building height equal to the stack height and use the 1.25 H <sub>s</sub> /H <sub>b</sub> column.  If H <sub>s</sub> /H <sub>b</sub> is between 1 and 1.25, then select the 1.25 column or interpolate between the 1.25 and 1.75 columns.  If H <sub>s</sub> /H <sub>b</sub> is between 1.75 and 2.5, then use the 1.75 column or interpolate between the 1.75 and 2.5 columns.									
be assumed.  141 3.7.3 Determine the ratio of the stack height to the influential building height by dividing the stack height, in feet, by the influential building height, in feet, H <sub>s</sub> /H <sub>b</sub> .  143 3.7.4 Determine the minimum distance, in feet, from the discharging stack to the secured property line. If there is no secured property line, then a distance of 25 feet shall be used.  145 3.7.5 Determine the appropriate annual factor from Table 2. This is done by selecting the column with the appropriate influential building height and H <sub>s</sub> /H <sub>b</sub> ratio, and selecting the row with the appropriate minimum distance to the secured property line.  148 3.7.5.1 If the influential building height is between values in the column headings, then use the lower value or interpolate between values in the column headings.  149 If H <sub>s</sub> is less than H <sub>b</sub> , then set the influential building height equal to the stack height and use the 1.25 H <sub>s</sub> /H <sub>b</sub> column.  150 3.7.5.2 If H <sub>s</sub> /H <sub>b</sub> is between 1 and 1.25, then select the 1.25 column.  151 3.7.5.3 If H <sub>s</sub> /H <sub>b</sub> is between 1.25 and 1.75, then use the 1.25 column or interpolate between the 1.25 and 1.75 columns.  152 3.7.5.5 If H <sub>s</sub> /H <sub>b</sub> is between 1.75 and 2.5, then use the 1.75 column or interpolate between the 1.75 and 2.5 columns.									
141 3.7.3 Determine the ratio of the stack height to the influential building height by dividing the stack height, in feet, by the influential building height, in feet, H <sub>s</sub> /H <sub>b</sub> .  143 3.7.4 Determine the minimum distance, in feet, from the discharging stack to the secured property line. If there is no secured property line, then a distance of 25 feet shall be used.  145 3.7.5 Determine the appropriate annual factor from Table 2. This is done by selecting the column with the appropriate influential building height and H <sub>s</sub> /H <sub>b</sub> ratio, and selecting the row with the appropriate minimum distance to the secured property line.  148 3.7.5.1 If the influential building height is between values in the column headings, then use the lower value or interpolate between values in the column headings.  149 If H <sub>s</sub> is less than H <sub>b</sub> , then set the influential building height equal to the stack height and use the 1.25 H <sub>s</sub> /H <sub>b</sub> column.  150 3.7.5.2 If H <sub>s</sub> /H <sub>b</sub> is between 1 and 1.25, then select the 1.25 column.  151 If H <sub>s</sub> /H <sub>b</sub> is between 1.25 and 1.75, then use the 1.25 column or interpolate between the 1.25 and 1.75 columns.  151 If H <sub>s</sub> /H <sub>b</sub> is between 1.75 and 2.5, then use the 1.75 column or interpolate between the 1.75 and 2.5 columns.			G, G						
142stack height, in feet, by the influential building height, in feet, $H_s/H_b$ .1433.7.4Determine the minimum distance, in feet, from the discharging stack to the secured144property line. If there is no secured property line, then a distance of 25 feet shall be used.1453.7.5Determine the appropriate annual factor from Table 2. This is done by selecting the146column with the appropriate influential building height and $H_s/H_b$ ratio, and selecting the147row with the appropriate minimum distance to the secured property line.1483.7.5.1If the influential building height is between values in the column headings, then use149the lower value or interpolate between values in the column headings.1503.7.5.2If $H_s$ is less than $H_b$ , then set the influential building height equal to the stack height151and use the $1.25 H_s/H_b$ column.1523.7.5.3If $H_s/H_b$ is between 1 and 1.25, then select the 1.25 column.1533.7.5.4If $H_s/H_b$ is between 1.25 and 1.75, then use the 1.25 column or interpolate between154the 1.25 and 1.75 columns.1553.7.5.5If $H_s/H_b$ is between 1.75 and 2.5, then use the 1.75 column or interpolate between156the 1.75 and 2.5 columns.									
143 3.7.4 Determine the minimum distance, in feet, from the discharging stack to the secured property line. If there is no secured property line, then a distance of 25 feet shall be used.  145 3.7.5 Determine the appropriate annual factor from Table 2. This is done by selecting the column with the appropriate influential building height and H <sub>s</sub> /H <sub>b</sub> ratio, and selecting the row with the appropriate minimum distance to the secured property line.  148 3.7.5.1 If the influential building height is between values in the column headings, then use the lower value or interpolate between values in the column headings.  150 3.7.5.2 If H <sub>s</sub> is less than H <sub>b</sub> , then set the influential building height equal to the stack height and use the 1.25 H <sub>s</sub> /H <sub>b</sub> column.  152 3.7.5.3 If H <sub>s</sub> /H <sub>b</sub> is between 1 and 1.25, then select the 1.25 column.  153 3.7.5.4 If H <sub>s</sub> /H <sub>b</sub> is between 1.25 and 1.75, then use the 1.25 column or interpolate between the 1.25 and 1.75 columns.  154 If H <sub>s</sub> /H <sub>b</sub> is between 1.75 and 2.5, then use the 1.75 column or interpolate between the 1.75 and 2.5 columns.		3.7.3							
property line. If there is no secured property line, then a distance of 25 feet shall be used.  3.7.5 Determine the appropriate annual factor from Table 2. This is done by selecting the column with the appropriate influential building height and $H_s/H_b$ ratio, and selecting the row with the appropriate minimum distance to the secured property line.  If the influential building height is between values in the column headings, then use the lower value or interpolate between values in the column headings.  If $H_s$ is less than $H_b$ , then set the influential building height equal to the stack height and use the 1.25 $H_s/H_b$ column.  If $H_s/H_b$ is between 1 and 1.25, then select the 1.25 column.  If $H_s/H_b$ is between 1.25 and 1.75, then use the 1.25 column or interpolate between the 1.25 and 1.75 columns.  If $H_s/H_b$ is between 1.75 and 2.5, then use the 1.75 column or interpolate between the 1.75 and 2.5 columns.									
Determine the appropriate annual factor from Table 2. This is done by selecting the column with the appropriate influential building height and H <sub>s</sub> /H <sub>b</sub> ratio, and selecting the row with the appropriate minimum distance to the secured property line.  If the influential building height is between values in the column headings, then use the lower value or interpolate between values in the column headings.  If H <sub>s</sub> is less than H <sub>b</sub> , then set the influential building height equal to the stack height and use the 1.25 H <sub>s</sub> /H <sub>b</sub> column.  If H <sub>s</sub> /H <sub>b</sub> is between 1 and 1.25, then select the 1.25 column.  If H <sub>s</sub> /H <sub>b</sub> is between 1.25 and 1.75, then use the 1.25 column or interpolate between the 1.25 and 1.75 columns.  If H <sub>s</sub> /H <sub>b</sub> is between 1.75 and 2.5, then use the 1.75 column or interpolate between the 1.75 and 2.5 columns.		3.7.4							
column with the appropriate influential building height and H <sub>s</sub> /H <sub>b</sub> ratio, and selecting the row with the appropriate minimum distance to the secured property line.  If the influential building height is between values in the column headings, then use the lower value or interpolate between values in the column headings.  If H <sub>s</sub> is less than H <sub>b</sub> , then set the influential building height equal to the stack height and use the 1.25 H <sub>s</sub> /H <sub>b</sub> column.  If H <sub>s</sub> /H <sub>b</sub> is between 1 and 1.25, then select the 1.25 column.  If H <sub>s</sub> /H <sub>b</sub> is between 1.25 and 1.75, then use the 1.25 column or interpolate between the 1.25 and 1.75 columns.  If H <sub>s</sub> /H <sub>b</sub> is between 1.75 and 2.5, then use the 1.75 column or interpolate between the 1.75 and 2.5 columns.									
row with the appropriate minimum distance to the secured property line.  If the influential building height is between values in the column headings, then use the lower value or interpolate between values in the column headings.  If H <sub>s</sub> is less than H <sub>b</sub> , then set the influential building height equal to the stack height and use the 1.25 H <sub>s</sub> /H <sub>b</sub> column.  If H <sub>s</sub> /H <sub>b</sub> is between 1 and 1.25, then select the 1.25 column.  If H <sub>s</sub> /H <sub>b</sub> is between 1.25 and 1.75, then use the 1.25 column or interpolate between the 1.25 and 1.75 columns.  If H <sub>s</sub> /H <sub>b</sub> is between 1.75 and 2.5, then use the 1.75 column or interpolate between the 1.75 and 2.5 columns.		3.7.5							
148 3.7.5.1 If the influential building height is between values in the column headings, then use the lower value or interpolate between values in the column headings.  150 3.7.5.2 If H <sub>s</sub> is less than H <sub>b</sub> , then set the influential building height equal to the stack height and use the 1.25 H <sub>s</sub> /H <sub>b</sub> column.  151 3.7.5.3 If H <sub>s</sub> /H <sub>b</sub> is between 1 and 1.25, then select the 1.25 column.  152 3.7.5.4 If H <sub>s</sub> /H <sub>b</sub> is between 1.25 and 1.75, then use the 1.25 column or interpolate between the 1.25 and 1.75 columns.  153 3.7.5.5 If H <sub>s</sub> /H <sub>b</sub> is between 1.75 and 2.5, then use the 1.75 column or interpolate between the 1.75 and 2.5 columns.									
the lower value or interpolate between values in the column headings. If $H_s$ is less than $H_b$ , then set the influential building height equal to the stack height and use the 1.25 $H_s$ / $H_b$ column. If $H_s$ / $H_b$ is between 1 and 1.25, then select the 1.25 column or interpolate between the 1.25 and 1.75 columns. If $H_s$ / $H_b$ is between 1.25 and 1.75, then use the 1.25 column or interpolate between the 1.25 and 1.75 columns. If $H_s$ / $H_b$ is between 1.75 and 2.5, then use the 1.75 column or interpolate between the 1.75 and 2.5 columns.		2751							
150 3.7.5.2 If $H_s$ is less than $H_b$ , then set the influential building height equal to the stack height and use the 1.25 $H_s$ / $H_b$ column.  152 3.7.5.3 If $H_s$ / $H_b$ is between 1 and 1.25, then select the 1.25 column.  153 3.7.5.4 If $H_s$ / $H_b$ is between 1.25 and 1.75, then use the 1.25 column or interpolate between the 1.25 and 1.75 columns.  154 If $H_s$ / $H_b$ is between 1.75 and 2.5, then use the 1.75 column or interpolate between the 1.75 and 2.5 columns.		3.7.5.1							
and use the $1.25~H_{\rm s}/H_{\rm b}$ column.  152 3.7.5.3 If $H_{\rm s}/H_{\rm b}$ is between 1 and 1.25, then select the 1.25 column.  153 3.7.5.4 If $H_{\rm s}/H_{\rm b}$ is between 1.25 and 1.75, then use the 1.25 column or interpolate between the 1.25 and 1.75 columns.  154 1.75 and 2.5, then use the 1.75 column or interpolate between the 1.75 and 2.5, then use the 1.75 column or interpolate between the 1.75 and 2.5 columns.		2750							
152 3.7.5.3 If $H_s/H_b$ is between 1 and 1.25, then select the 1.25 column. 153 3.7.5.4 If $H_s/H_b$ is between 1.25 and 1.75, then use the 1.25 column or interpolate between 154 the 1.25 and 1.75 columns. 155 3.7.5.5 If $H_s/H_b$ is between 1.75 and 2.5, then use the 1.75 column or interpolate between 1.75 and 2.5 columns.		3.7.3.2	ÿ						
153 3.7.5.4 If $H_s/H_b$ is between 1.25 and 1.75, then use the 1.25 column or interpolate between the 1.25 and 1.75 columns.  154 3.7.5.5 If $H_s/H_b$ is between 1.75 and 2.5, then use the 1.75 column or interpolate between the 1.75 and 2.5 columns.		2753	3 0						
the 1.25 and 1.75 columns. 155 3.7.5.5 If $H_s/H_b$ is between 1.75 and 2.5, then use the 1.75 column or interpolate between the 1.75 and 2.5 columns.									
155 3.7.5.5 If $H_s/H_b$ is between 1.75 and 2.5, then use the 1.75 column or interpolate between the 1.75 and 2.5 columns.		3.1.3.2							
the 1.75 and 2.5 columns.		3755							
		5.1.5.0	<u> </u>

Notes for Table 2:

Bldg Ht is the building height, in feet,

H<sub>s</sub>/H<sub>b</sub> is the ratio of the stack height to the building height,

Stack Ht is the stack (or release) height, in feet, and

The annual factor is in units of  $(lbs/hr)/(\mu g/m^3)$ .

#### **SECTION 4** Tier 3 - SCREEN3 and TSCREEN Models

4.1 The maximum concentration of a toxic air contaminant from a process or process equipment in the ambient air may be determined by using the EPA SCREEN3 or TSCREEN models, using the appropriate algorithm for the type of emission release, for example, stack or fugitive. The maximum concentration derived from the use of one of these models, with the

## [If adopted, this would be a new regulation] [Changes to Draft #1 are redlined and double underlined]

- adjustment identified in section 4.2 as appropriate, is then used in determining compliance with the EA levels in Regulation 5.21 by using the applicable equation in Regulation 5.21 section 2.2, 2.5, or 2.8.
  - 4.2 The resulting maximum concentration from the SCREEN3 or TSCREEN model is in units of  $\mu g/m^3$  for a 1-hour averaging time. If the averaging time for a benchmark ambient concentration (BAC) for the specific toxic air contaminant as determined pursuant to Regulation 5.20 is other than 1 hour, then the resulting maximum concentration shall be adjusted as follows:
  - 4.2.1 For a BAC with an 8-hour averaging time, multiply by 0.44,
    - 4.2.1 For a BAC with a 24-hour averaging time, multiply by 0.22, and
    - 4.2.1 For a BAC with an annual averaging time, multiply by 0.02.
  - 4.3 The SCREEN3 model shall be run in the "regulatory default mode" as described in the SCREEN3 User's Guide (EPA-454/B-95-004). This document is available on the Internet at "www.epa.gov/scram001/userg/screen/screen3d.pdf".
  - 4.4 If the TSCREEN model is used, the model inputs and options used shall be included with the modeling results submitted to the District pursuant to Regulation 5.21.
  - 4.<u>53</u> The SCREEN3 model may be downloaded for free from the Internet <u>at from the EPA's web</u> <u>page</u> "www.epa.gov/scram001/tt22.htm#SCREEN3".
  - 4.<u>64</u> The TSCREEN model may be downloaded for free from the Internet <u>at from the EPA's web page</u> "www.epa.gov/scram001/tt22.htm#TSCREEN".

#### **SECTION 5** Tier 4 - EPA-Approved Dispersion Model

- 5.1 The maximum concentration of a toxic air contaminant from a process or process equipment in the ambient air may be determined by using the EPA Industrial Source Complex Model (ISC3) model or another appropriate model included in Appendix A Summaries of Preferred Air Quality Models of 40 CFR Part 51 Appendix W Guideline on Air Quality Models.

  Additionally, a model included in Appendix B Summaries of Alternative Air Quality Models of 40 CFR Part 51 Appendix W may be used, provided that the use of the Appendix B model meets one of the three conditions for approval specified in Appendix B section B.0 Introduction and Availability and prior approval is given by the District. The maximum concentration derived from the use of one of these models is then used in determining compliance with the EA levels in Regulation 5.21 by using the applicable equation in Regulation 5.21 section 2.2, 2.5, or 2.8.
- 5.2 In running one of the models allowed pursuant to section 5.1, the model shall be set to report the maximum concentration for the averaging time period consistent with the averaging time established for the toxic air contaminant pursuant to Regulation 5.20.
- 5.3 The ISC3 model shall be run in the "regulatory default mode" as described in the *User's*Guide for the Industrial Source Complex (ISC3) Dispersion Models, Volume 1 (EPA-454/B-95-003a). This document is available on the Internet at "www.epa.gov/scram001/userg/regmod/isc3v1.pdf".
- The ISC3 model may be downloaded for free from the Internet <u>at from the EPA's web page</u> "www.epa.gov/scram001/tt22.htm#ISC".
